## 1 PROBLEM

Using directional vectors, show that the points

$$\begin{pmatrix} 2 \\ 1 \end{pmatrix}, \begin{pmatrix} 4 \\ 7 \end{pmatrix}, \begin{pmatrix} 5 \\ 4 \end{pmatrix} \text{ and } \begin{pmatrix} 1 \\ 4 \end{pmatrix} \quad (1.0.1)$$

are vertices of a parallelogram.

## 2 EXPLANATION

Two lines are parallel if their respective directional vectors are in the same ratio.

Let the points be denoted by:

$$\mathbf{A} = \begin{pmatrix} 2 \\ 1 \end{pmatrix} \quad (2.0.1)$$

$$\mathbf{B} = \begin{pmatrix} 5 \\ 4 \end{pmatrix} \quad (2.0.2)$$

$$\mathbf{C} = \begin{pmatrix} 4 \\ 7 \end{pmatrix} \quad (2.0.3)$$

$$\mathbf{D} = \begin{pmatrix} 1 \\ 4 \end{pmatrix} \quad (2.0.4)$$

The directional vector of  $\mathbf{AB}$  is

$$\begin{pmatrix} 2 - 5 \\ 1 - 4 \end{pmatrix} = \begin{pmatrix} -3 \\ -3 \end{pmatrix} \quad (2.0.5)$$

The directional vector of  $\mathbf{BC}$  is

$$\begin{pmatrix} 5 - 4 \\ 4 - 7 \end{pmatrix} = \begin{pmatrix} 1 \\ -3 \end{pmatrix} \quad (2.0.6)$$

The directional vector of  $\mathbf{CD}$  is

$$\begin{pmatrix} 4 - 1 \\ 7 - 4 \end{pmatrix} = \begin{pmatrix} 3 \\ 3 \end{pmatrix} \quad (2.0.7)$$

The directional vector of  $\mathbf{AD}$  is

$$\begin{pmatrix} 2 - 1 \\ 1 - 4 \end{pmatrix} = \begin{pmatrix} 1 \\ -3 \end{pmatrix} \quad (2.0.8)$$

The directional vector of  $\mathbf{AC}$  is

$$\begin{pmatrix} 2 - 4 \\ 1 - 7 \end{pmatrix} = \begin{pmatrix} -2 \\ -6 \end{pmatrix} \quad (2.0.9)$$

Since the directional vectors of  $\mathbf{AB}$  and  $\mathbf{CD}$  are in the same ratio, so  $\mathbf{AB}$  and  $\mathbf{CD}$  are parallel and also opposite to each other.

Similarly, the directional vectors of  $\mathbf{BC}$  and  $\mathbf{AD}$  are in the same ratio, hence  $\mathbf{BC}$  and  $\mathbf{AD}$  are parallel and opposite.

Since the two pairs of opposite sides are parallel, the given points are the vertices of the parallelogram.

Moreover the sum of the directional vectors of  $\mathbf{AB}$  and  $\mathbf{BC}$

$$\begin{pmatrix} -3 \\ -3 \end{pmatrix} + \begin{pmatrix} 1 \\ -3 \end{pmatrix} = \begin{pmatrix} -3 + 1 \\ -3 - 3 \end{pmatrix} = \begin{pmatrix} -2 \\ -6 \end{pmatrix}$$

Thus  $\mathbf{AB} + \mathbf{BC} = \mathbf{AC}$ , which satisfy parallelogram law of vector addition i.e vector sum of two adjacent side of a parallelogram is the diagonal vector of the parallelogram.
